

Kelvin Wey Han Chan

kelvin.chanwh@rocketmail.com | +44 7856 514849 | [linkedin.com/in/kelvinchanwh](https://www.linkedin.com/in/kelvinchanwh) | London, United Kingdom

Data Scientist specialising in Generative AI and Large Language Models, with strong Python and statistical modelling expertise. Experienced in building forecasting models leveraging macroeconomic data to model demand dynamics and sales performance, alongside rapidly prototyping and deploying LLM-driven systems. Strong communicator with a track record of delivering AI solutions and insights to technical and non-technical stakeholders.

EDUCATION

University of Cambridge

Oct 2022 – Jun 2023

- MPhil Advanced Computer Science (Natural Language Processing)

University of Malaya

Feb 2018 – Feb 2022

- BEng Electrical Engineering (First Class Honours)

Technical Skills: (*Programming & ML*) Python, PyTorch, TensorFlow, C++, SQL, Git, Docker, MLFlow, AzureML
(*NLP & LLM*) LangChain, DSPy, Databricks, Multilingual NLP, LLM Evaluation, Instruction Tuning

WORK EXPERIENCE

Data Scientist, Shell

Aug 2023 – Present

- Built GenAI pipelines for post-hoc model explainability, integrating unstructured text with structured time-series model outputs to produce interpretable insights and macroeconomic outlook analyses for business stakeholders
- Designed end-to-end ML & AI pipelines (AzureML) for training, evaluating and quantising deep learning vision models, achieving 20× lower inference energy usage with minimal performance degradation.
- Developed and productionised LLM-based agentic systems, implementing adaptive dialogue policies and tools to automate resolving 84% of routine customer interactions.
- Implemented a robust evaluation framework for GenAI systems, assessing response quality, safety constraints, latency, robustness to distribution shift and resistance to prompt-based attacks.

Data Science Intern, NXP Semiconductors

Jun 2021 – Oct 2021

- Applied embedding-based NLP models and clustering techniques to analyse large volumes of unstructured technician logs and error reports, creating a high-quality labelled dataset for evaluating hardware failure modes.
- Built a time-series regression model to predict testing yield and forecast component-specific failures two production lots in advance, enabling preventive intervention.

Firmware Engineering Intern, Western Digital

Jun 2020 – Sep 2020

- Developed internal visualisation and diagnostic tools to map bad sectors in hard disks, reducing average debugging time by 43 minutes per case.

Data Science Intern, The Center of Applied Data Science

Jan 2018 – Feb 2018

- Scraped and analysed 50k+ job postings, applying keyword clustering and statistical analysis to map latent skill topics to compensation trends, producing data-driven labour market insights.

RESEARCH EXPERIENCE

Grammar Error Correction for Code-switched Sentences ([LREC-COLING 2024](#))

Dec 2022 – Jun 2023

- Conducted a systematic study of grammar error correction for code-switched text, proposing a synthetic CSW data generation framework via span-level translation with linguistically motivated constraints.
- Demonstrated consistent improvements (+1.57% F_{0.5} over GECToR) via controlled experiments on re-annotated multilingual datasets, showing robust cross-lingual transfer across typologically similar CSW languages.
- Supervisors: Dr. Zheng Yuan & Dr. Chris Bryant, University of Cambridge
